Sequence 10789, Application US/09949016

Patent No. 6812339

GENERAL INFORMATION:

APPLICANT: VENTER, J. Craig et al.

TITLE OF INVENTION: POLYMORPHISMS IN KNOWN GENES ASSOCIATED

TITLE OF INVENTION: WITH HUMAN DISEASE, METHODS OF DETECTION AND USES THEREOF;

FILE REFERENCE: CLOOKIN307

CURRENT APPLICATION NUMBER: US/09/949,016

CURRENT FILING DATE: 2000-04-14

PRIOR APPLICATION NUMBER: 60/231,758

PRIOR FILING DATE: 2000-10-20

PRIOR FILING DATE: 2000-10-03

PRIOR FILING DATE: 2000-09-08

NUMBER OF SEC ID NOS: 207012

SOCTWARE: PRESC FOR WINDOWS Version 4.0

SEQ ID NO 10789
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  129 KLININYNQAFELLTYDNQELL--LSKLEVLDD-VSDLKEQIHSNMSGTRRSHNKKSNDED 185
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ------QNQFLLQRLAQMEAENNRLSQQVAQLSAEVRGSRHSTPTSSSPAS 168

Comment=The level of each isoform is regulated by a splicing
event that occurs when the UPR is induced by IRE1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Basic motif.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

bZIP transcription factor-like protein - Arabidopsis thaliana
N;Alternate names: protein T4E10.190
C;Species: Arabidopsis thaliana (mouse-ear cress)
C;Date: 20-Apr-2000 #sequence_revision 20-Apr-2000 #text_change 31-Dec-2004
C;Accession: T47621
R;Obermaier, B; Ottenwaelder, B; Duchemin, D.; Zeitler, K.; Mewes, H.W.; Lemcke, K.; Neumetred to the Protein Sequence Database, March 2000
A;Reference number: Z24463
A;Accession: T47621
A;Accession: T47621
A;Residues: preliminary
A;Molecule type: DNA
A;Residues: 1-403 <OBE>
A;Cross-references: UNIPRAC:QPMIG6; UNIPARC:UPIO0000A86BF; EMBL:AL138656
A;Experimental source: cultivar Columbia; BAC clone T14E10
                                                                                                                                                                                                                                                                            8

Increasing the secretion of a heterologous protein, such as a therapeutic or an industrial enzyme, in genetically modified eukaryotic cells by inducing an elevated unfolded protein response (UPR).

Example 3; SEQ ID NO 6; 83pp; English

The invention describes a method of increasing the secretion of a heterologous protein in a eukaryotic cell, comprising inducing an elevated unfolded protein response (UPR). Also described are: an isolated nucleic acid encoding a HAC1 protein, where the HAC1 protein induces unfolded protein response and has less than 50% similarity to yeast HAC1 protein; an isolated nucleic acid encoding a HAC1 protein, where the HAC1 protein induces unfolded protein response and where the HAC1 protein comprises a DNA binding region that has greater than 70% similarity to the DNA binding region of filamentous fungi HAC1 protein; a protein having unfolded protein response inducing activity and having greater

The invention describes a method of increasing the secretion of a heterologous protein in a eukaryotic cell, comprising inducing an electrologous protein in a eukaryotic cell, comprising inducing an electrologous protein response (URP). Also described are: an isolated mucleic acid encoding a HAC1 protein, where the HAC1 protein induces unfolded protein response and has less than 50% similarity to yeast HAC1 protein; an isolated mucleic acid encoding a HAC1 protein, where the HAC1 protein induces unfolded protein response and where the HAC1 protein comprises a DNA binding region that has greater than 70% similarity to the DNA binding region of flamentous fungi HAC1 protein; a protein having unfolded protein response inducing activity and having greater than 70% similarity to a fully defined amino acid sequence of 5EQ ID NO: 2, 4, or 16, or 12 or 14, cresponse and has at least 70% similarity to a fully defined amino acid sequence of 130 or 43% amino acide scoding a HZC2 protein that modulares unfolded protein response and has at least 70% similarity to a fully defined amino acid sequence of 130 or 43% amino acide scoding a IRE1 protein that modulates unfolded protein response modulating activity and having greater consideration; an isolated mucleic acid encoding a IRE1 protein that modulates unfolded protein response modulating activity and having greater than 70% similarity to SEQ ID NO: 8 or 10; and a consideration of the encologous nucleic acid encoding a protein having unfolded protein response modulating activity and having greater than 70% similarity to SEQ ID NO: 8 or 10; and a collicating a protein response modulating activity and a heterologous nucleic acid encoding a protein having unfolded protein response modulating and converse and encoding a protein having unfolded protein response (EVP) and a collication of interest to be secreted. The methods and compositions of protein of interest to be secreted. The methods and compositions of proteins, are useful in e.g. production of therapeutic or industrial 
Increasing the secretion of a heterologous protein, such as a therapeutic or an industrial enzyme, in genetically modified eukaryotic cells by inducing an elevated unfolded protein response (UPR).
                                                                                                                                                                                                                                                                   Example 3; SEQ ID NO 4; 83pp; English

                                  The present sequence is that of the hacA protein of Aspergillus nidulans, as deduced from the newly isolated hacA gene (see AAH26932). HacA protein is a transcription factor involved in the unfolded protein response (UPR). The invention provided methods or increasing the secretion of a heterologous protein in a cell by inducing an elevated UPR. This can be achieved by modulating the activity of HACI (or hacA), PTC2 or IREI in the cell, e.g. by gene overexpression. The cell from which the protein is secreted can be any cell having an UPR, such as mammalian cells, insect cells, yeast and filamentous fungi. The protein of interest can be any secreted protein such as a therapeutic protein or an industrial enzyme,
                                                                                                                                                                                                                                                                                                                                                                                                                                                             239

The present invention relates to methods for increasing the secretion of heterologous protein in eukaryotic cells by inducing an elevated unfolded protein response (UPR). The method involves inducing the elevated UPR by increasing the presence of proteins such as HAC1, HACA, PTC2 or IRE1 in cells. The method and sequences are useful for increasing the secretion of heterologous proteins (e.g. lipase, cellulase, carbohydrase) in eukaryotic cells useful in industry to increase protein yields and to facilitate purification. The present sequence is Aspergillus midulans hacA protein. (Updated on 29-AUG-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               119

Saloheimo MLA;

Wang H, Valkonen MJ,

The present sequence is that of the hacA protein of Aspergillus niger var. awamori, as deduced from hacA cDNA (see AAH26933). HacA protein is a transcription factor involved in the unfolded protein response (UPR).

C transcription of an inducing form of hacA enables production of higher levels of secreted heterologous proteins in A. niger. The invention provides methods for increasing the secretion of a heterologous protein provides methods for increasing the secretion of a heterologous protein call by inducing an elevated UPR. This can be achieved by modulating the activity of HAC1 (or hacA), PTC2 or IRE1 in the cell, e.g. by gene overexpression. The cell from which the protein is secreted can be any cell manna in UPR, such as mammalian cells, insect cells, yeast and illamentous fungi. The protein of interest can be any secreted protein such as a therapeutic protein of interest can be any secreted protein cuch as therapeutic protein or an industrial enzyme, e.g. lipase, cellulase, endoglucanase. H, protease, carbohydratase, reductase, oxidase, isomerase, transferase, kinase, phosphatase, alpha-amylase, glucoamylase, ilgnocellulose hemicallulase, postinase and ligninase (claimed). (Updated on 11-SEP-2003 to standardise OS field) DB 4; Length 342; Local Similarity Sequence 342 AA; Query Match

The present invention relates to methods for increasing the secretion of heterologous protein in eukaryotic cells by inducing an elevated unfolded protein response (UPR). The method involves inducing the elevated UPR by increasing the presence of proteins such as HAC1, HAC4, PTC2 or IRE1 in cells. The method and sequences are useful for increasing the secretion of heterologous proteins (e.g. lipase, cellulase, carbohdrase) in. eukaryotic cells useful in industry to increase protein yields and to facilitate purification. The present sequence is Aspergillus niger var.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           58 QELPVPKTNLPPRKRAKTEDEKEQRRIERVLRNRAAAQTSRERKRLEMEKLENEKIQMEQ 117

The invention describes a method of increasing the secretion of a clevated unfolded protein in a eukaryotic cell, comprising inducing an elevated unfolded protein response (UPR). Also described are: an isolated nucleic acid encoding a HAC1 protein, where the HAC1 protein induces unfolded protein response and has less than 50% similarity to yeast HAC1 protein induces unfolded protein response and where the HAC1 protein comprises a DNA binding region that has greater than 70% similarity to the DNA binding region of filamentous fungi HAC1 protein, a protein comprises a DNA binding region of filamentous fungi HAC1 protein, a protein comprises a DNA binding region of filamentous fungi HAC1 protein, a protein comprises a DNA binding region of filamentous fungi HAC1 protein, a protein comprise of solution acids (SEQ ID NO: 2, 4 or 16, or 12 or 14, or 180, o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      a therapeutic

The methods and compositions of genetically manipulating cells to have an elevated unfolded protein response (UPR) resulting in an increased capacity to produce secreted proteins, are useful in e.g. production of therapeutic or industrial enzymes. This is the amino acid sequence of an Aspergillus nidulans hach
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            unfolded protein response; UPR; HAC1; PTC2; unfolded protein response modulator; enzyme production; hacA; chaperone;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Increasing the secretion of a heterologous protein, such as or an industrial enzyme, in genetically modified eukaryotic inducing an elevated unfolded protein response (UPR).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Wang H, Valkonen MJ, Saloheimo MLA;

The method involves inducing the elevated UPR by increasing the presence of proteins such as HAC1, HACA, PTC2 or IRE1 in

unfolded protein response modulator; enzyme production; hacA; chaperone;
               secretion
cells. The method and sequences are useful for increasing the secretion of heterologous proteins (e.g. lipase, cellulase, carbohydrase) in eukaryotic cells useful in industry to increase protein yields and to facilitate purification. The present sequence is Aspergillus niger var. awamori hach protein
                                                                                                                                                                                                                                                                                                                                                      5 DRFSPVKMEDAFANSPITPSLEVPVLTVSPADTSLRTKNVVA-QTKPEEKKPAKKRKSWG

The invention describes a mearyotic cell, comprishing the secretion of a clearated unfolded protein in aukaryotic cell, comprishing inducing an elevated unfolded protein in eabnase (UPR). Also described are: an isolated cold encoding a HAC1 protein, where the HAC1 protein induces unfolded protein response and where the HAC1 protein, where the HAC1 protein induces unfolded protein response and where the HAC1 protein comprises a DNA binding region of filamentous fungi HAC1 protein; a protein of comprises a DNA binding region that has greater than 70% similarity to filamentous fungi HAC1 protein; a protein comprises a DNA binding region of filamentous fungi HAC1 protein; a protein comprise in folded protein response inducing activity and having greater than 70% similarity to a fully defined amino acid sequence of SEC ID NO: 2, 4 or 16, or 12 or 14, or 16, as given in the specification; a protein having an amino acid sequence of SEC ID NO: 2, 4 or 16, an isolated nucleic acid encoding a PTC2 protein that modulates unfolded protein response and has at least 70% similarity to a fully defined amino acid sequence of 130 or 438 amino acids (SEC ID NO: 8 or 10) as given in the specification; an isolated nucleic acid encoding a response and has at least 60% similarity to a fully defined amino acid sequence with SEC ID NO: 12, 14, and protein chaving unfolded protein response and has at least 60% similarity to a having unfolded protein response modulating activity and having unfolded protein response modulating activity and having unfolded protein response modulating activity and a nineased capacity to protein of interest to be secreted. The methods and compositions of composition of interest to be secreted. The methods and compositions of proteins, are useful in e.g. production of therapeutic or industrial companies. This is the amino acid sequence of Aspergillus nicidinas HAC1 characements.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ų,

The present invention relates to methods for increasing the secretion of heterologous protein in eukaryotic cells by inducing an elevated unfolded protein response (URR). The method involves inducing the elevated URR by increasing the presence of proteins such as HACL, HACA, PTC2 or IRE1 in cells. The method and sequences are useful for increasing the secretion of heterologous proteins (e.g. lipase, cellulase, carbohydrase) in eukaryotic cells useful in industry to increase protein yields and to facilitate purification. The present sequence is Trichoderma reesei HACl protein. (Updated on 29-AUG-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            143

the terrologous protein in a eukaryotic cell, Comprising the secretion or a clevated unfolded protein in a eukaryotic cell, Also described are: an isolated elevated unfolded protein response (UPR). Also described are: an isolated nucleic acid encoding a HAC1 protein, where the HAC1 protein induces unfolded protein response and has less than 50% similarity to yeast HAC1 protein induces unfolded protein cacid encoding a HAC1 protein, where the HAC1 protein comprises a DNA binding region that has greater than 70% similarity to the DNA binding region of filamentous fungi HAC1 protein; a protein comprises a DNA binding region of filamentous fungi HAC1 protein; a protein having unfolded protein response inducing activity and having greater than 70% similarity to a fully defined amino acid sequence of $80 to 1232 amino acids (SEQ ID NO: 2, 4 or 16, or 12 or 14, conclication acids (SEQ ID NO: 2, 4 or 16, or 12 or 14, conclication acids (SEQ ID NO: 2, 4 or 16, or 12 or 14, conclication acids encoding a PTC2 protein that modulates unfolded protein capponse and has at least 70% similarity to a fully defined amino acid sequence of 130 or 438 amino acids (SEQ ID NO: 8 or 10) as given in the specification; an isolated mucleic acid encoding a REI protein that condilates unfolded protein response and has at least 60% similarity to a fully defined amino acid sequence with SEQ ID NO: 12 to 14; an isolated condilates unfolded protein response and has at least 60% similarity to a fully defined amino acid sequence with SEQ ID NO: 12 to 14; an protein chaving unfolded protein response and has at least 60% similarity to a fully defined amino acid sequence with SEQ ID NO: 12 to 14; an protein chaving unfolded protein response and has at least 60% similarity to a fully defined amino acid sequence with SEQ ID NO: 2 to 14; an protein chaving unfolded protein response modulating activity and having greater than 70% similarity cost of secreted. The methods and compositions of protein of interest to be secreted. The methods and compositions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Increasing the secretion of a heterologous protein, such as a therapeutic or an industrial enzyme, in genetically modified eukaryotic cells by inducing an elevated unfolded protein response (UPR).

The invention describes a method of increasing the secretion of a heterologous protein in a eukaryotic cell, comprising inducing an electrologous protein in a eukaryotic cell, comprising inducing an electrologous protein response (UPR). Also described are: an isolated mucleic acid encoding a HAC1 protein induces unfolded protein response and has that protein induces to protein; an isolated mucleic acid encoding a HAC1 protein, where the HAC1 protein isolated mucleic acid encoding a HAC1 protein, where the HAC1 protein and where the HAC1 protein induces unfolded protein response and where the HAC1 protein comprises a DNA binding region of flamentous fungi HAC1 protein; a protein having unfolded protein response inducing activity and having greater than 70% similarity to a fully defined amino acid sequence of SEQ ID NO: 2, 4, 8, 10, 12, 14 or 16, or 13 or 14, response and has alleas for sequence of SEQ ID NO: 2, 4, 8, 10, 12, 14 or 16, or 13 or 14, response and has at least 70% similarity to a fully defined amino acid sequence of 130 or 438 amino acids (SEQ ID NO: 8 or 10) as given in the specification; a protein having a protein response and has at least 70% similarity to a fully defined amino acid sequence of 130 or 438 amino acids encoding a protein having unfolded protein response and has at least 60% similarity to a fully defined amino acid sequence modulates unfolded protein response modulates unfolded protein response modulating activity and having greater than 70% similarity to SEQ ID NO: 8 or 10; and a protein tresponse modulates unfolded protein response modulating activity and a heterologous nucleic acid encoding a protein having unfolded protein response modulating activity and a conduction of interest to be secreted. The methods and compositions of protein of interest to be secreted. The methods and compositions of protein of interest to be secreted. The methods and compositions of protein cappanes (UPR) resulting in an increased capacity to produce secreted proteins are useful in e.g. production of 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        21;
                                       Increasing the secretion of a heterologous protein, such as a therapeutic or an industrial enzyme, in genetically modified eukaryotic cells by inducing an elevated unfolded protein response (UPR).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    130

as deduced from the newly isolated HAC1 gene (see AAH26931). HAC1 protein
is a transcription factor involved in the unfolded protein response
(UPR). The invention provides methods for increasing the secretion of a
checkerologous protein in a cell by inducing an elevated UPR. This can be
chieved by modulating the activity of HAC1, PTC2 or IRB1 in the cell,
c e.g. by gene overexpression. The cell from which the protein is secreted
can be any cell having an UPR, such as mammalian cells, insect cells,
yeast and filamentous fungi. The protein of interest can be any secreted
protein such as a therapeutic protein or an industrial enzyme, e.g.
ilpase, cellulase, endoglucanase-H, protease, carbohydratase, reductase,
cyidase, isomerase, transferase, kinase, phosphatase, alpha-amylase,
clucamylase, lignocellulose hemicellulase, pectinase and ligninase
(claimed). (Updated on 11-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         47
